directed against at least 2 mRNAs selected from target genes, coding and con-coding regions of RNAs corresponding to target genes, coding and con-coding regions of RNAs corresponding to target genes, coding and con-coding regions of RNAs corresponding to target genes, coding and and coding regions, intron-exon borders, the 5'-end, the 3' codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3' codons, genomic flanking regions, and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX5512-74. These multiple target oligonucleotides from sequences AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic thinitis, acute asthma, allergies, asthma, impeded respiration, respiratory diseases (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, colon cancer, breast cancer, lung cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-excon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-excon borders, the 5'-end, the 3'
codonistions of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55120-74. These multiple target oligonucleotides
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
cassociated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
caute asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
cult asterma allergies asthma, impeded respiration, are cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, melanoma, hepatic metastases, as
colon cancer, breast cancer, which may metastasize or have metastasized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
con-coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
codonitions or mixtures. The antisense oligonucleotides may be derived
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
conditions. Typical diseases and conditions are those
diseases and conditions. Typical diseases and conditions are those
cassociated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, respiratory
caute asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
clisease (CODD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, melanoma, hepatic metastases, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets concleid acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c.g. impaired airways, including lung disease and diseases whose secondary impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the construction and inflammation. AAA32313 to the lungs, including crelease of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent to invention, which correspond to SEQ ID No:1 to 2815, and then the present correspond to SEQ ID No:1 to 2815, and then the last 185 for invention, which correspond to SEQ ID No:1 to 2815, and then the last 185 for from the previously named sequences. SEQ ID No:1 to 1680 (AAA3232) to AAA3392) are specifically claimed ONS from the present invention. N B. Sequences given in the disclosure of the present invention. N B. Sequences given in the sequence of the present invention. Here is a prince of the present invention. Here is a prince of the present invention.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or continuition. The ON can have antialial antiallergic, antialiary inflammation. The ON can have antialial associated with inflammation. The one treatment of diseases associated with inflammation, cuseful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasconstriction, allergies, asthma, cimpeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive cracinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the crack decorption and inflammation. AAA32313 to AAA35312 represent the concludence are also called SEQ ID NO:1 to 185, but the sequences given in the sequence listing from the present convention, which correspond to SEQ ID NO:1 to 185, but the sequences differ convention of the previously named sequences. SEQ ID NO:1 to 185, but the sequences of from the previously named sequences. SEQ ID NO:1 to 185, but the sequences of from the previously named sequences. SEQ ID NO:1 to 185, but the sequences of from the previously named sequences. SEQ ID NO:1 to 185, but the sequence of from the previously named sequences. SEQ ID NO:1 to 185, but the sequences of from the previously named sequences. SEQ ID NO:1 to 185, but the sequences of from the previously named sequences. SEQ ID NO:1 to 185, but the sequence of the previously named sequences are necessared. AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c. grobaemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the observations with activates adenosine receptors causing chronic squences given in the sequence listing from the present the nucleotide sequences given in the sequence listing from the present convention, which correspond to SEQ ID NO:1 to 1821, and then the last 185 centerion, and chan the last 185 centerion, and chan the last 185 centerion and inflammation. AAA32131 to AAA331231 to AAA331231

```

```
The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits denosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligomucleotide composition of the containing less than 15th adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' compositions between coding and non-coding sequences), or to all segments of mRNA encoding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and least no agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and (Ib), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine (particularly where associated with ischaemia, toxin release and/or creating supraventricular tachycardia); (adult) respiratory distress syndrome
                                                                                                                                                       ö

(1) is an adenosine A2a receptor agonist (1a), or an oligonucleotide (1b), containing less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (1.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and has A1, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (1) may be a mixture of (1a)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; adenosine Al receptor; antisense oligonucleotide; hypoxia; adenosine As receptor; adenosine As receptor; adenosine As receptor; phosphorothicate; cardioqualmonary failure; renal failure; ischaemia; endotoxin release; ARDS; acute respiratory distress syndrome; cytoprotective; anti-allergic; anti-inflammatory; anti-hypoxic; anti-chlorate; allergic shinitis; acute inflammation; chronic obstructive pulmonary disease; ss.

                genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3') ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the denosine Al, A2a, A2b or A3 receptors, and has A1, A2b or A3 agonist the denosine A1, A2a, A2b or A3 receptors, and least no agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive
                                                                                                                                                                                                                                                                                         pulmonary disease; cardiopulmonary hypoxia associated with administration of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02719, AAA02721 and AAA02723 to AAA03715 represent specifically claimed phosphorothicate antisense oligonucleotides for use in the composition of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers
containing less than 15% adenosine (A), that is antisense to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (C) ingunucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cartivating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, chemokines, adhesion molecules and their receptors, cytokines and chemokine receptors, adenosine receptors, bradynin receptors, cytokines and chemokine receptors, bradynin receptors, contral nervous system (CNS) and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and creeptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy (les) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergic syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary disease (OPDD), cyllmonary transplantation rejection, pulmonary disease (OPDD), cyllmonary transplantation rejection, pulmonary infections bronchitis, and/or the management and antisense oligonucleotides used in the exemplification of the present invent and antisense oligonucleotides used in the exemplification of the paragers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pain; cystic fibrosis; allergic rhinitis; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (2) can have respiratory, bronchodilator, antinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (1) can be used to down-regulate the expression and or activity of target polypeptides associated with clung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunosuppression and ransmitters, transcription factors, chemokines, endogenously produced specific and non-specific enaymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system (CNS) and peripheral nervous and non-nervous system creceptors, defensines, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome conditions elected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome whitened renewablants in the period of the peri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS;

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (II) can have respiratory, bronchodilator, antinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cartivating peptide factors and malignancies, such as stimulating and cartivating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, immunoglobulins and antibodies, antibody receptors, cytokines and chemokine, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide to receptors, binding proteins and malignancy associated proteins. The transmitters defensins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction) and/or bronchoconstriction, and/or lung inflammation, and/or bronchoconstriction, and/or lung inflammation, allergie asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CP), allergic rhinitis (AR), pulmonary conditions elected from pulmonary vasoconstriction, inflammation, allergies, and/or encer AAFIB434 to AAFIS1543 represent human polynucleotide in the exemplification of the manner and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, pulmonary transplantation rejection, chronic obstructive pulmonary disease, pulmonary infection, bronchitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire printed specification, but fire wipo.int/pub/published_pct_sequences

has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antiense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the continuitation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or casal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entisfinammatory steroid in a subject, for reducing levels of continion or continion and inflammation, lung allergies, or treating bronchodilation, increasing levels of ubiquinone or culturg suffactant in a subject is tissue, or treating bronchodilation, continions in the printed continion but was obtained in electronic format directly from WIPO
                                                                        Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory; steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, 5' or 2' end genomic flanking regions, 5' and 3' intron-exon junctions or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiaethmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or therapeutic respiratory effect of an antishind a respiratory is an enabled; for reducing or depleting levels of or enhancing the prophylactic or therapeutic respiratory effect of an antishind pronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine lung inflammation, lung allergies, or a respiratory disease or condition, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung unflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cat fip. wipo.int/pub/published_pct_sequences Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; anniallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic chinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ds. the invention describes a novel composition, all strike active agent, comporising oligomucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, creducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, creducing adenosine sensitivity, levels of adenosine containers are derived from agene encoding or regulating congruence and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery construction of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered cor availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung corresponding to inflammation, allergies, asthma, impeded respiration, respiratory confistes syndrome, pain, cystic fibrosis, altergie kindings to lung to transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the variant, heart, kinds, serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of the uniquence of the notice of the anti-sense or condition to the system event any unwarted effects that free adenosine environment and thereby, to recover the angent and the system of the anti-sense and the system of the anti-sense and the system of the original succession in the target RNA serves to prevent the breakdown of t Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antifinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; bronchitis; pulmonary transplantation rejection; ds. This invention describes a novel composition (a) a first active agent, S Gaps Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted tnucleic acids associated with lung airway or lung dysfunction, and ä ö Aguilar 58.7%; Score 9.4; DB 1; Length 13; 90.9%; Pred. ```
analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing of treating a respiratory, lung or malignant disease. The administered composition comprises objoing and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis, pulmonary transplantation rejection, pulmonary infections, bronchitis, or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ဌ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pabalan J, Aguilar D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 13 BP; 2 A; 3 C; 7 G; 1 T; 0 U; 0 Other;

31-OCT-2002.

Homo sapiens

oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and

bronchodilating agent.

Pharmaceutical composition for treating asthma, has antisense

```
This interior describes a novel comportation of the factor of the factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligonucleotides into products that free adenosine into the system .. lung, brain, heart, kidney, etc, tissue environment and thereby, to vent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          invention describes a novel composition (a) a first active agent,

```
Novel polynucleotide having ability to increase labeling efficiency of labeling compound, useful for synthesizing labeled protein in presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a polymucleotide (I) for synthesizing labeled protein and having ability to increase labeling efficiency of labeling compound, where protein is produced by adding labeling compound to 3' terminal of sequence encoding target protein of gene template, where labeling compound has label portion and acceptor portion having compound capable of binding to C-terminus of label portion and translating gene template in presence of labeled compound (I) is useful for producing a labeling protein, which involves preparing a gene template by adding (I) to the 3'-terminal of base sequence encoding the target protein, translating gene encoding the target protein synthesized in the translation system. The base sequence encoding the target protein either contains synthesized in the translation system. The base sequence encoding the target protein either contains the termination codon or does not contain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the termination codon. The labeling compound is added after the initiation of the translation. The labeled protein (LP1) is useful in a performance-analysis of a protein, which involves contacting the test substance with (LP1), and analyzing the interaction between the protein and the test substance. (I) has the ability to increase labeling efficiency of a labeling compound and thus effectively produces labeled protein. This sequence corresponds to a sequence used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 9.4; DB 1; Length 13;

The present invention describes a new composition comprising an antisense cligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic acids the compositions are useful for the treatment of diseases associated with inflammation, comparing the compositions are useful for the treatment of diseases and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating of a subject. They can be used for treating c.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive cultiprosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including to breast and prostate cancer. The reduction of the adenosine content of the construction and inflammation. AAA32312 to AAA32312 respected the processor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nuclectide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                      antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory' bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cycostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cappression and or activity of target polypeptides associated with cappression and or activity of target polypeptides associated with cappression and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, immunoglobulins and antibodies, antibody receptors, cytokine and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradyinin receptors, central cerceptors, adenosine receptors, bradyinin receptors, central cerceptors, defensines, growth factors, vasocative peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders and creceptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders and/or bronchoconstriction) and/or lunging inflammation, allergy (ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding regions, 5' and genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiaschmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels

of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine AI receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.
                                                                                                                                                                                                          Gaps

The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or
                                                inflammation in humans or other animals e.g. asthma, pulmonary disease, allergy, emphysema and cystic fibrosis

The specification describes antisense oligonucleotides (AAX52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene initiation
codons, genomic flanking regions, intron-excon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all
codons, sepments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oilgonucleotides may be derived
from sequences AAX55272-74. These multiple target oligonucleotides
(Specifically AXX53180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
cautte asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
                                                                                                                                                                ö
prevent conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease, allergy, emphysema and cystic fibrosis

The antisense oligonucleotides may be derived from sequences AAX5527-4. These multiple target oligonucleotides (specifically AAX5180-271) can be used for the antisense treatment of diseases and conditions are thosse associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

Claim 18; Page 366; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating eg. ischemaic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,

```
carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the Nos reduces side effects. The A-containing ONS break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the mucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1690 (AAA32323 to AAA3392) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              listing

New antieense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or cancers

Claim 18; Page 364; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antishiflammatory, antiallergic, antisthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation,

```
impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (CODD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including the breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the relaces of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA12313 to AAA3512 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA2323 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention. On matching the previously mander actions. The previous matching sequences given in the sequence invention do not matching the previous practices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; adenosine Al receptor; antisense oligonucleotide; hypoxia; adenosine As receptor; adenosine As receptor; adenosine As receptor; phosphorothicate; cardiopulmonary failure; renal failure; ischaemia; endotoxin release; ARDS; acute respiratory distress syndrome; cytoprotective; anti-allergic; anti-inflammatory; anti-hypoxic; envisable supraventricular tachycardia; allergic rhinitis; acute inflammation; chronic obstructive pulmonary disease; ss.

The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits

CC adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

C(1), containing less than 15‡ adenosine (M), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3'

CC ends or segments between coding and non-coding sequences), or to all

CC has Al, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia)

CC has Al, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia)

CC and (lb), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine

CC (particularly where associated with isothemia, toxin release and/or ceptor-mediated active sepsies); allergic rhintis; chronic obstructive (e.g. amsociated with sepsies); allergic rhintis; chronic obstructive (e.g. associated with sepsies); allergic rhintis; chronic obstructive (c.g. with actue inflammation. AAA02717, AAA02719, AAA02721 and AAA02722 and AAA03715 represent specifically claimed phosphorothioate antisense coligonucleotides for use in the composition of the present invention.

CC AAA03715 represent specifically claimed phosphorothioate antisense corposition in the exemplification of the reason recognition of the present invention. ö Human; adenosine Al receptor; antisense oligonucleotide; hypoxia; adenosine As receptor; adenosine As receptor; adenosine As receptor; phosphorothicate; cardiopulmonary failure; renal failure; ischaemia; endotoxin release; ARDS; acute respiratory distress syndrome; cytoprotective; anti-allergic; anti-inflammatory; anti-hypoxic; entrallar tachycardia; allergic rhinitis; acute inflammation; chronic obstructive pulmonary disease; ss. renal injury.

```
The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits

Cd adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide

(Ib), containing less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (ie. 5' or 3'

c ends or segments between coding and non-coding sequences), or to all

segments of mRNA encoding the adenosine (A), A2a, A2b or A3 receptors, and

c segments of mRNA encoding the adenosine (I) may be a mixture of (Ia)

compositions are used to prevent, alleviate and/or treat adenosine

compositions are used to prevent, alleviate and/or treat adenosine

c ceceptor-mediated cardiac, lung and/or renal damage or failure

c particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating

c pulmonary disease; cardiopulmonary hypoxia associated with administration

c surpraverse-test agente, particularly where such conditions are associated with acute inflammation. AAA02119, AAA02721 and AAA02731 to AAA03715 represent invention.

c AAA03715 represent specifically claimed phosphorothioate antisense

condigonucleotides for use in the composition of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Low adenosine antisense oligonucleotide, phosphorothioate, allergy, human, airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory, bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypercension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

The present invention describes low adenosine (A) content antisense oligonuclectides and compositions (I) comprising them. In the antisense oligonuclectides and compositions (I) comprising them. In the antisense (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and malignancies, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central contractions system (TMS) and peripheral nervous and non-nervous systems. Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions. receptors, CNS and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; humanistich dependent depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; allergac rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; condition selected from pulmonary vasoconstriction, inflammation, allegies, asthma, impeded respiration, respiratory distress syndrome (RDS) pain, cystic fibrosis (CF), allegic thinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplanterion rejection, pulmonary infections, bronchitis, and/or cancer. The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. CC The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with undyrespiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, inding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adhosion molecules and their receptors, cytokine and chemokine receptors, adhosion molecules and non-nervous system (CNS) and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, bradykinin receptors, central creeptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (sepecially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergice, antisament conditions elected from pulmonary vasocoiated with a disease or condition selected from pulmonary vasocoiated with a disease or condition selected from pulmonary vasocoinstriction, inflammation, allergic synding condition employeement condition elected from pulmonary vasocoiated with a disease (OPD), when the selection which are associated with a disease (OPD), when the selection is suppressed to the pronched or suppression of particulation, respectively of surfaction mulmonary vasociated processes syndrome or surfactors and conditions elected from pulmonary disease or conditions and particulation elected from pulmonary infertions which are respect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers

mucin 1/MUC1 (ABB77476), Transmembrane isogene. The invention describes novel genetic variants of the MUC1 gene. The invention is useful for haplotyping pencyping the MUC1 gene. The invention is useful for chaplotyping pencyping the MUC1 gene in an individual and identifying an association between a trait and at least one of the haplotypes or haplotype pairs of MUC1 and expressing MUC1 protein for use in screening for and idunction of MUC1 and expressing MUC1 protein for use in screening for candidate drugs to treat diseases related to MUC1 activity and in studying the effect of the variation on the biological activity of MUC1 as well as on the binding affinity of candidate drugs targeting MUC1 for the treatment of e.g. cancer. MUC1 as further used by the pharmaceutical research scientist to validate MUC1 as a candidate target for and in design of clinical trials of candidate drugs for, treating a specific condition frugs or dasease predicted to be associated with MUC1 activity. MUC1 antibodies are useful in a variety of diagnostic and prognostic formats and therapeutic methods. The present sequence is that of a PCR primer for detecting MUC1 polymorphisms, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; antisense; lung dysfunction; nasal airway dysfunction; antialiamatory; steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity;

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytoetatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine or ecceptor, producing perceptor, increasing levels of edenosine or ecceptor, producing perceptor, increasing levels of edenosine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity;

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coding regalon, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of receptor, producing procholation, increasing levels of definition or receptor, producing procholation, increasing levels of definitions. Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds. This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating by the comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating control of bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, curdicated defined as a tendencial or requiating or requiating or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a certification are areanergic agonist. The composition of successive and cytostatic activity, is a beta-adrenergic agonist. The composition disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies, asthma; impeded respiration, respiratory confitted such as pulmonary vasoconstriction, with a disease or condition such as pulmonary vasoconstriction, with a disease or condition such as pulmonary vasoconstriction, with a disease or condition such as pulmonary vasoconstriction.

The reduced demonsine content of the anti-sense oligon corresponding to transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligonucleotides into products that free adenosine into the system of thymidines present in the target RNA serves to prevent the breakdown of thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products th
beta-adrenergic agonist, respiratory disease, pulmonary vasoconstriction, respiratory distress syndrome; allergic rhinitis, pulmonary hypertension, emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;

S Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and WPI; 2003-093058/08.

Claim 15; SEQ ID NO 10153; 763pp; English.

bronchodilating agent.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligomucleotides, (c) device, in separate containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is composition comprises of malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to composition compute the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or surfactant hypoproduction are associated distress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary impeded respiration, applicant, and the pulmonary disease, pulmonary disease, pulmonary disease, pulmonary disease, pulmonary contractions or conditions and contractive pulmonary disease, pulmonary disease, pulmonary contractions or conditions and contractive pulmonary disease. This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. tissue environment and thereby, to transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, prevent any unwanted effects due to it

comparising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine Sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (C) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or reduce the amount of target polypeptide present in the lungs. The contains allowed the contains and contains and contains and contains and contains and contains the lungs. The reduce the amount of target polypeptide present in the lungs. The composition and/or bronchoconstriction and/or lung in the langer.

with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergie; pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary hypertension, rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine Al receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothicate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The

The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between ciding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions are those
                            where they
antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung
                                                                                                     prevent conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pulmonary vasoconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypoconstriction; emphysema; chronic obstructive pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatcocallular carcinoma; kidney cancer; melanoma; hepatic metastasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
              diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary of disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastasses, as well as all types of cancers which may metastasize or have metastasses, to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; adenosine receptor; low adenosine antisense oligonucleotide; phosphorothioate; impaired respiration; inflammation; allergy; allergic diseases; bronchoconstriction; inhibitor; antiinflammatory; antiallergic, antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cyteic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.
                                                                                                                                                                                                                                                                                                Gaps

          Fibroais, pulmonary hypertension, emphysems, chronic obstructive fibroais, pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may wetastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA33313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:1 to 185, but the sequences differ handlay3923 are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention. N.B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide (Ib), containing less than 15% adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. % or 3, ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 agonist activity or A2a antegonist activity (or at least no agonist activity or A2a antegonist activity (or at least no agonist activity or A2a antegonist activity (or at least no agonist activity or LNA and or more surfactants The compositions are used to prevent, alleviate and/or treat adenosine receptor-mediated cardiac, lung and/or renal damage or failure receptor-mediated cardiac, lung and/or renal damage or failure receptor-mediated with ischaemia, toxin release and/or enginteration of druge or lingaging agents, e.g. adenosine for treating supravantricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive of stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02717, AAA02719, AAA02721 and AAA02722 to AAA03715 represent specifically claimed phosphorothicate antisense oligonucleotides for use in the composition of the present invention. AAA02718, AAA02722 and AAA03730 represent of the present of the present invention.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (C) is an have respiratory, bronchodilator, antisinflammatory, analgesic, immunosuppressive, antisathmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and expression and or activity of target polypeptides associated with communoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-nervous system (CNS) and peripheral nervous and non-nervous system (CNS) and peripheral nervous and non-nervous system peptide receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy is and/or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or pulmonary infections, bronchitis, and/or cancer. ```
The invention relates to the construction of a vector which comprises a multiple number of Shear Stress Response Elements (SSRE) from various gene promoter sequences and one or more genes, antisense molecules, ribozymes, double stranded RNA, or a nucleic acid which encodes a repressor antibody or a mutant protein which inhibits the synthesis of, or activity of the protein or peptide. This sequence represents the Splanding sequence used as SSRE. The vector is useful for stimulating or inhibiting vascular endothelial cell or capillary endothelial cell proliferation and for stimulating angiogenesis in cells. The vector or gene of interest is useful for modulating vascular permeability in a mammal, for stimulating or inhibiting the formation, maturation or regression of blood vessels, modulating genes or proteins involved in a diseases, down regulating angiogenesis and for treating vasculogenic and/or angiogenic disorders. These disorders include cardiovascular disorder, hypercholesterolaemia and wound healing
                                                                                                                                response elements,
on, stimulating or down
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory; sucroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppresaive; cycostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                             useful for modulating endothelial cell proliferation, stimulating or dow -regulating angiogenesis and treating vasculogenic/angiogenic disorders.

first active agent comprising an oligomuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention and an antiinflammatory teroid and ubiquinone. A composition of the invention immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The cligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered cor availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and or surfactant hypoproduction are associated in fillammation, allergies and/or brundant proproduction are associated in the manner and allergies and/or brundant proproduction are associated in the manner and allergies and/or brundant and/or lung and allergies and or surfactant hypoproduction are associated and allergies and or surfactant the argument and allergies and or surfactant argument and a surfactant argument and allergies and or surfactant argument and allergies and or surfactant argument argument and argument and allergies and or surfactant argument argument argument and allergies and or surfactant argument argu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           with a disease or condition such as pulmonary vasoconstriction, furflammedion, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RT-PCR, primer; amplification; reverse transcription; RNA fingerprinting; differential gene expression; ss.
                                                                                                    Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention provides a method for the differential screening of gene expression by random primed reverse transcription PCR (RT-PCR). The primer sequences are generated by stimulating PCR reactions on non-redundant mammalian nucleotide sequence databank entries containing at least 1,000 bp of coding region. The primers selected, such as the present one, had to meet various criteria such as having an efficiency index between 2-10, having a selectivity index higher than 1, being 12 bp long i.e. 8 C or G and 4 T or A, and each primer differed from the others in at least 5 of the 8 bases at the 3'-end. The invention claims the selected primers make it possible to use internally primed, PCR-based RNA differential and province and systematic analysis of
                                                                                                                                                      Differential screening of gene expression by reverse transcription polymerase chain reaction - uses random priming with primers selected for high efficiency and selectivity by computer screening of database(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; ide nucleic acid; cytosine methylation; cardiovascular; primer; ss; ral nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              differential gene expression as an advantageous alternative to differential display. The method can also be useful for isolating new coding sequences and to compare known and new genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotide primer SEQ ID NO 322859 for detecting SNP TSC0031084.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 tepereent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretracted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010 +ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic forms are from WIPO at

comparing The present invention describes a method for screening controllers of INK4 family gene expression comprising: (a) contacting a test substance with test cells sustaining at least 1 structural gene located at a position at which it can be controlled by the promoter; and (b) comparine expression dose of such structural gene in the cells with that obtained in a non-contact run for selection of a substance affecting expression dose of such structural gene in the cells with that obtained dose of such structural gene in the cells. INK4 family gene expression controllers have cytostatic, antianaemic, hepatotropic, cerebroprotective, cardiant and vulnerary activities. The screened substances can be used in preventives and remedies for cancer, hypoplastic anaemia, hepatocirrhosis, myocardial infarction, cerebral apoplaxia and wounds. The present sequence represents a human pl9 core promoter region, f the property and the intervence of the inter Sequence 12 BP; 0 A; 7 C; 4 G; 1 T; 0 U; 0 Other; exemplification of the present invention. New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related disorders

Claim 11; SEQ ID NO 459; 159pp; English

least 20 but not more than 1500 consecutive nucleotides of the optimeurin promoter appearing as ADE13890. Also included are the optimeurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optimeurin promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample The invention relates to an isolated nucleic acid (N1) comprising at

in a sample containing DNA, determining the presence or increased susceptibility to glaucoma or to a progressive ocular hypertensive disorder resulting in loss of visual field in a patient (or the severity or progression of glaucoma in a patient, comprising providing amplification reaction primers that direct amplification of a selected nucleic acid region containing the variation within the optimeurin promoter and amplifying the DNA burning appropriation of a selected obtaining a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optimeurin promoter, and detecting the polymorphism). The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The present sequence is an optimeurin promoter motif, repeat element or obtained from a cell or bodily fluid (comprising detecting a polymorphism in a promoter region of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing NNA, detecting the presence of an optineurin promoter sequence variation putative regulatory region. \$

Detection of Neisseria gonorrhoeae DNA - using oligo:nucleotide probes and primers based on the pilE gene of N. gonorrhoeae.

Claim 1; Page 5; 29pp; English.

Primers AAQ80633-39 are primers synthesised based on the sequence of the Neisseria gonorrhoeae pilE gene between bases 827-972 (see AAQ80641). This primer is based on the sequence between bases 945-934 of the pilE gene. The primers can be used to PCR amplify this region for detection by hybridisation with probe AAQ80640. The primers are used in primers sets: the forward primers being AAQ80631, AAQ80635, AAQ80636 or AAQ80638 and the reverse primers: AAQ80631 or 80639. These primers and those in AAQ80642-5 can be used in kits for the detection of N.gonorrhoeae infections. (Updated on 25-MAR-2003 to correct PN field.)

This invention describes a novel catalytic RNA molecule which is directed against mRNA molecules (II) which encode the cell-relevant protein cyclin B or E2F1. The products of the invention have vasotropic activity and can be used for gene tharapy. The use of (I), or a DNA molecule or a plasmid of the invention is claimed for obtaining a vector for gene therapy and for inhibiting restenosis of blood vessel after angloplasty; therapeutic compositions containing these components are also claimed. (I) efficiently induces cell cycle arrest by combined inactivation of cyclin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A recombinant Adenylyl cyclase is described which lacks membrane bound domains. Separation and purification of the recombinant enzyme is much easier compared with wild type enzymes and the recombinant enzyme is more stable than the wild type enzyme which allows easier screening of compounds that stimulate and inhibit Adenylyl cyclase activity. The compinant adenylyl cyclase comprises a chimera of adenylyl cyclase C_1 and C_2 domains linked covalently. The domains may be linked by a linker peptide. The recombinant adenylyl cyclase is useful for screening inhibitors and stimulators of adenylyl cyclase activity. Inhibitors of the enzyme are useful for treating cholera, pituitary tumors, heart failure, ischaemais, endocrine disorders and cell necrosis. Stimulators of adenylyl cyclase are useful for treating pseudohypoparathyroidism and other endocrine deficiencies
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Adenylyl cyclase; type I; type II; recombinant; enzyme; cAMP; cyclic AMP; adenosine monophosphate; screening; stimulation; inhibition; treatment; cholera; pituitary tumour; heart failure; ischaemia; endocrine disorder; cell necrosis; pseudohypoparathyroidism; endocrine deficiency; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel soluble mammalian polypeptide composition comprising adenylyl cyclase activity for screening stimulators and inhibitors of adenylyl cyclase, is activated by Gsalpha.

                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genemic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE99989, ABF00010-ABE99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABC0010-ABE9989, ABH0010-ABH99989 and ABI0010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent din not form part of the printed specification, but was obtained in electronic format from WIPO at

The adenosine receptor mRNA secondary cructure of this targets mRNA. The adenosine receptor mRNA secondary cructure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or protein conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease, allergy, emphysema and cystic fibrosis

Sequences AAV46501-V47446 are anti-sense oligonuclectides that target the human adenosine A1 receptor, the design of which required the secondary controlled this targets mRNA. The adenosine receptor mRNA secondary structure of this targets mRNA. The adenosine receptor mRNA secondary controlled the analysed and used to construct antisense coligonucleotides containing a phosphorothicate backbone. Once the antisense molecules are created they can be used to target their containing either a junction between the introl and exon, or where they containing either a junction between the introl and exon, or where they may overlap the initiation codon. The receptor is a member of the G-containing coupled family of cell surface receptors that have 7.

The antisense conditions associated with bronchoconstriction and/or lung conditions associated with animals e.g. asthma, pulmonary disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.

The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inflammation in humans or other animals e.g. asthma, pulmonary disease,

The specification describes antisense oligonucleotides (AAX52869-X55271)

directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
cend and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense coligonucleotides may be derived
from sequences AAX5512-4. These multiple target oligonucleotides
from sequences AAX55180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
casociated with impaired respiration and inflammation, allergic rhinitis,
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
distant asthma, allergies, asthma, impeded respiration,
cultures syndrome, pain, cystic fibrosis, pulmonary hypertension,
cultures avoconstriction, emphysema, chronic obstructive pulmonary
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, panceratic cancer,
choncancer, breast cancer, lung cancer, metastasized
well as all types of cancers which may metastasize or have metastasized
                                                                                                                                                                                                                                                                                         Antisense oligonucleotide; multiple target; antisense treatment; impaired respiration; inflammation; lung disease; pulmonary vasconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pancreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides used in treatment of, e.g. pulmonary vasoconstriction.
                                                                                                                                                                                                                                                          Human adenosine Al receptor antisense oligonucleotide fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 8.4; DB 1; Length 10; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX5520-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary by asyndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                               impaired respiration; infimmation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis; pulmonary vasoconstriction; inflammation; allergic rhinitis; acute asthma; allergy asthma; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; carcinoma; colon cancer; breast cancer; lung cancer; pencreatic cancer; hepatocellular carcinoma; kidney cancer; melanoma; hepatic metastasis;

The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of disease associated with inflammation, inpaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating cet of including lung distriction, allergies, asthma, implement of disease syndrome, pain, cystic impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the concludes adenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the curdencing given in the sequence listing from the present convented invented as given in the sequence listing from the present convented invented on SEQ ID NO:1 to 2815, and then the last 185 carcinomas are also called SEQ ID NO:1 to 185, but the sequences differ

ö The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, and an have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating impeded respiration, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive fubrosis, pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the om the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to A333992) are specifically claimed ONs from the present invention. ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA33313 to AAA33312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1860 (AAA33333 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a new composition comprising an antisense oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are impaired airways, including lung disease associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; adenosine receptor; low adenosine antisense oligonucleotide; phosphorothioate; impaired respiration; inflammation; allergy; allergy disease; bronchoconstriction; inhibitor; antinflammatory; antiallergic, antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.
                                                                                                                                                                                                                                                                                                                                        Gaps

impeded respiration, respiratory distress syndrome, pain, cystic impeded respiration, respiratory distress syndrome, pain, cystic fibroars, pulmonary hypetrension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the constant and prostate cancer. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleoride sequences given in the sequence listing from the present invention, which correspond to SEQ ID No:1 to 2815, and then the last 185 sequences are also called SEQ ID No:1 to 185, but the sequence differ from the previously named sequences. SEQ ID No:11 to 1680 (AAA3233 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention do not match or with their corresponding SEO ID NO: sequences given in the sequence

tissue (i.e. are upregulated in metastatic breast tumour cells). AA283942

C to AA286677 represent tags corresponding to distinct transcripts that are

CC transcribed in the primary or non-metastatic breast tumour

CC tissue (i.e. are downregulated in metastatic breast tumour cells). These

CC transcripts can be used for diagnosis, prognosis, monitoring and

CC transcripts can be used for diagnosis, prognosis, monitoring and

CC transcripts can cancer, particularly where metastatic. Diagnosis is

CC transcripts are used to direct sexpression of the transcripts are potentially

CC ompounds that modulate expression of the transcripts are potentially

CC ompounds that modulate expression of the transcripts are potentially

CC office transcripts are used to direct expression, in selected cell types, of

CC e.g. the transcripts are used to direct expression, in selected cell types, of

CC yaccines, Polypeptides encoded by the transcripts are also useful in

CV vaccines, for diagnosing breast cancer and for raising specific

antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic

CC agents. Host cells that produce the polypeptides can be used to expand

CC agents. Host cells that produce the polypeptides can be used to expand

CC alls, e.g. cytotoxic T lymphocytes, and these used for adoptive

CC immunotherapy

that are preferentially transcribed in the metastatic breast tumour cells). AAZ80767 to AAZ80341 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZ86577 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. theorapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific transcribes (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter immorberance cells, e.g. cytotoxic T lymphocytes, and these used for adoptive

                           The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide and so is an expension of the containing less than 15¢ adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (1.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A, A2b or A3 receptors, and segments of mRNA encoding the adenosine A, A2b or A3 receptors, and last and optionally at this receptor). (I) may be a mixture of (Ia) and Optionally at this receptor). (I) may be a mixture of (Ia) and Optionally at this receptor). (I) may be a mixture of (Ia) compositions are used to prevent, alleviate and/or treat adenosine compositions are used to prevent, alleviate and/or treat adenosine (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular atchycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmonary hypoxia associated with administration of stress-test agents, particularly where such conditions are associated with administration of stress-test agents, particularly where such conditions are associated with administration of stress-test agents, particularly where such conditions are associated with administration of stress-test agents, particularly where such conditions are associated with administration of stress-test agents, particularly where such conditions are associated with administration of stress and seculated

The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits

Cd adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

C(I) is an adenosine Aza receptor agonist (Ia), or an oligonucleotide

C(Ib), containing less than 15% adenosine (A), that is antisense to target

CC (Ib), containing less than 15% adenosine (A), that is antisense to target

CC (ID), containing RNA, to genomic flanking regions (i.e. 5' or 3'

C ends or segments between coding and non-coding sequences), or to all

CC (Bas Al, Azb or Al agonist activity or Aza antagonist activity (or at

CC (Bas Al), Azb or Al agonist activity or Aza antagonist activity (or at

CC (Bas Al), and optionally also contains one or more surfactants. The

CC (Compositions are used to prevent, alleviate and/or treat adenosine

CC (particularly where associated with ischaemia, toxin release and/or

CC (Barticularly where associated with ischaemia, toxin release and/or

CC (Barticularly where associated with ischaemia, toxin release and/or

CC (Barticularly where associated with sepains); (adult) respiratory distress syndrome

CC (B. associated with sepsis); allorgic rhinitis; chronic obstructive

CC (Barticularly where associated with administration

CC (Barticularly where sectionallarly where such conditions are associated

CC (Barticularly where agents, particularly where such conditions are associated

CC (Barticularly where agents, particularly where such conditions are associated

CC (Barticularly where agents, particularly where such conditions are associated

CC (Barticularly and AAA02717, AAA027121 and AAA02721 and AAA02721 and AAA03715 represent interaction. AAA02717, AAA03712 and AAA037212 and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine Aza receptor agonist (Ia), or an oligonucleotide compositions are corresponding succeptor agonist (Ia), that is antisense to target compositions or corresponding RNA, to genomic flanking regions (Ie. 5' or 3') and so resements between coding and non-coding sequences), or to all sequences of mRNA encoding the adenosine Al, AZa, AZb or Al agonist activity or AZa antagonist activity (or at least no agonist activity or AZa antagonist activity (or at least no agonist activity or AZa antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and (Ib), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine for receptor-mediated cardiac, lung and/or renal damage or failure (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); allergic rhinitis; chronic obstructive pulmonary disease; cardiopulmonary hypoxia associated with administration of series agents, particularly where such conditions are associated with acute inflammation. The present invention describes low adenosine (A) content antisense oligonuclectides and compositions (I) comprising them. In the antisense oligonuclectides and compositions (I) comprising them. In the antisense oligonuclectides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and malignancies, transcription factors, immunoglobulins and antibodyse antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (UNS) and peripheral nervous and non-nervous systems.
                                                                                                                                                                                                                                                                                                                                      Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         receptors, CNS and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 118; 1592pp; English.

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (II) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with ungivespiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creceptors, defensins, growth factors, vasocative peptides and receptors, binding proteins and malignancy associated proteins. The artisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome condition selected from pulmonary associated with a disease (CNDD) when any proprious condition and proprious condition, respiratory distress syndrome condition and proprious condition, respiratory distress syndrome condition and proprious condition, respiratory distress syndrome condition condition and proprious conditio pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of hypertension, emphysema, chronic obstructive pulmonary disease (COPD)

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.

Claim 14; Page 117; 1592pp; English.

The present interiton describes low adenosine (A) content antisense oligonucleotides and compositions (I) composition than the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with cury disorders and malignancies, usen as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and cativating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokine and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies activities and non-receptors. Committees, adhesion molecules and non-receptors, cretaying proteins, adenosine receptors, bradykinin receptors, central creceptors, and peripheral nervous and non-nervous system peptide creceptors. And peripheral nervous and non-nervous system peripheral nervous and non-nervous system creceptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction and/or lung inflammation, allergy(ies) and/or suddition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide The present invention describes low adenosine (A) content antisense

888888 ઠે 셤 The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonanotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of antifungal drugs comprising: (a) contacting a test substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a yeast cell comprising contacting a yeast cell with a candidate drug and contacting expression in the yeast cell of at least 1 NORF gene whose contropring expression in the yeast cell of at least 1 NORF gene whose contropring expression in the yeast cell of at least 1 NORF gene whose contropring expression in the yeast cell of at least 1 NORF gene whose controprises of the cell cycle, the differentially contacting as markers of the cell cycle, the differentially ö Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle. fragments and antisense oligonucleotides used in the exemplification of Gaps Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SACB; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds. ö Score 8.4; DB 1; Length 10; Pred. The invention relates to genotyping human galanin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI gene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. The method is useful for determining the or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of specification. This is useful for improving the efficacy and reliability of seases associated with GALRI activity, e.g., infectious diarrhoea and ciscases associated with GALRI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds transcring GALRI to treat a specific conditions or disease associated with GALRI activity. The method is useful to screen for compounds the expression and function of GALRI, and in expressing GALRI protein for use in screening for candidate drugs to treat diseases related to GALRI cativity. The polymucleotide or variant is useful in studying expression of the GALRI isogenes in vivo, for in vivo screening and testing of drugs targeted against GALRI protein, and for studying the effect of the
                                                                                                                                                                                                                                                                                                                                                                                            ö
methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genotyping human galanin receptor gene of an individual for determining haplotype of an individual, involves determining the identity of nucleotide pair at specific polymorphic sites for two copies of the gene.
                                                                                                                                                                                                                                                                                                                                                                                            Gaps

variation on the biological activity of GALR1 as well as on the binding affinity of candidate drugs targeting GALR1 for the treatment of infectious diarrhoea and growth hormone insufficiency. AAS98289- AAS98408 represent human GALR1 gene allale-specific oligonuclectides used to detect GALR1 gene polymorphisms as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for haplotyping the cytochrome P450, subfamily IID, polypeptide 6 (CYP2D6) gene (ABG72215, ABG72364) of an individual, and also describes 29 novel polymorphic sites within the human CYP2D6 gene is located on chromosome 22q13.1 and contains 9 exons which encode a 497 amino acid protein (ABB09563). CYP2D6 is a mono-oxygenase involved in the detoxification of many drugs and environmental chemicals. It plays a role in the metabolism of drugs such as antiarrhythmics, adrenoreceptor antagonists and tricyclic antidepressants, and is also involved in the formation of a metabolite linked to the drug-induced lupus syndrome observed with procainamide. Variations in CYP2D6 activity or expression may also influence an individual's susceptibility to environmentally-linked diseases, and it has been demonstrated that CYP2D6 activity may be involved in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; cytochrome P450; subfamily IID polypeptide 6; CYP2D6; enzyme; chromosome 22q13.1; drug metabolism; detoxification; mono-oxygenase; antiarrhythmia; adrenoreceptor antagonist; hypertension; tricyclic antidepressant; procainamide; drug induced lupus syndrome; environmentally linked disease; Parkinsons's disease; haplotyping; genotyping; haplotype; genetic variant; single nucleotide polymorphism; SNP; drug screening; drug discovery; primer extension; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel genetic variants of Cytochrome P450, Subfamily IID, Polypeptide 6 isogenes, useful for improving efficiency and reliability in drug development for treating hypertension, arrhythmias and Parkinson's

CC form of the enzyme tending to have an earlier onset of this condition.

CC (YP220 nucleic acid sequences are useful in studying the expression and function of CYP205, and in expressing CYP206 protein for use in screening drugs for the treatment of CYP205 ensociated diseases (e.g., drugs for the treatment of CYP205 ensociated diseases (e.g., and atnal ventricular arrhythmias, Parkinson's disease, and drug-induced lupus syndrome) or which are metabolised by CYP205.

CC PODD mucleic acids and proteins are also useful in studying the effect of polymorphisms on the biological activity of CYP205. Polymorphisms in the target region may be determined by the use of allele-specific of polymorphism on the biological activity of CYP205. Polymorphisms in the target region may be determined by the use of allele-specific oligonucleotides (ASOS; ABQ72217-ABQ72303) as probes and primers, and by primers comprising sequences ABQ72304-ABQ72304. The method of the invention is useful for haplotyping the companies of the cype of in populations and in individuals, enabling decisions to be made as to whether CYP205 is a likely therapeutic target for a disease of interest, and to control for genetically based bias in the design of drugs that target or are metabolised by CYP206. In addition, transgenic confinals comprishing a human CYP206 gene are useful for studying the expression of CYP206 isogenes in vivo, for in vivo screening and testing the expression of CYP206 isogenes in vivo, for in vivo screening and cesting the caspociated conditions in a biological system. Sequences ABQ72361 represent sequences that are specifically claimed as components or primer are serviced to or metabolisms in the CYP206 gene by primer are analysic or primers or primers and compounds for treating cype or primers or primers are seed to detect polymorphisms in the CYP206 gene by primer are analysic. ö Gaps Human SCYB14 preferred oligonucleotide detection primer SEQ ID NO:30. subfamily B member 14; SCYB14; SNP

inflammatory responses.

The present invention describes genetic variants of the human small inducible cytokine subfamily B (Cys-X-Cys), Member 14 (BRAK) (SCYB14) gene. SCYB14 sequences have antiinflammatory activity. The polymorphic coarriants are useful in studying the expression and function of SCYB14, in expressing SCYB14 protein for use in screening for candidate drugs to treat diseases related to SCYB14 activity, in studying the effect of the coarriants on the biological activity of SCYB14, and the binding affinity of candidate drugs targeting SCYB14 for the treatment of disorders involving inflammatory responses. Haplotyping methods from the present invention are useful in validating SCYB14 as a candidate target for treating a specific condition or disease predicted to be associated with SCYB14 activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with SCYB14 cc activity. Transpenic animals are useful for studying expression of the SCYB14 isogenes in vivo, for in vivo screening and testing of drugs cargeted against SCYB14 protein, and for testing the efficacy of therapeutic agents and compounds for disorders related to platelet . 0 The invention relates to an isolated polynucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALM1). The polymorphic variant comprises an CALM1 isogene defined by a haplotype selected from haplotypes 1-21 given in the specification. The polymorphisms are useful for studying the biological function of CALM1 as Gaps New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in expressing CALM1 protein for use in screening for candidate drugs to treat diseases related to CALM1 activity such as Alzheimer's disease. preferred oligonucleotide detection primer for the human SCYB14 gene system. . 0 The invention relates to an isolated polynucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALMI). The polymorphic variant comprises an CLMI isogene defined by a haplotype selected from haplotypes 1-21 given in the specification. The polymorphisms are useful for studying the biological function of CALMI as well as in identifying drugs targeting this protein for the treatment of a disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting CALMI to treat a specific condition or disease predicted to be associated with CALMI activity. Establishing CALMI haplotype or haplotype pair of an individual is useful for improving the efficiency and well as in identifying drugs targeting this protein for the treatment of a disorder related to its abnormal expression or function. The polymorphic variants may also be used in screening for compounds targeting CALM1 to treat a specific condition or disease predicted be associated with CALM1 activity. Establishing CALM1 haplotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with SCYM3 activity, e.g. Alzheimer's disease and diseases involving defects in calcium-dependent signal transduction. Haplotyping the CALM1 gene in an individual is also useful in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with CALM1 activity, AAS55892-AAS56018 represent human CALM1 allele- specific Gaps New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in expressing CALM1 protein for use in screening for candidate drugs to treat diseases related to CALM1 activity such as Alzheimer's disease. 1 receptor (TACR1) gene of 10-100 nucleotides comprising a fragment the fragment in the fragment is a polymorphic site or a complement of the fragment. The TACR1 segment is useful for analysing a nucleic acid, by obtaining the nucleic acid from an individual, and determining the base occupying any one of the polymorphic sites in the segment. The nucleic acid is obtained from several individuals, and the base occupying one of the polymorphic sites is determined in each of the individuals, and the presence of a disease phenotype, and each of the individuals for the presence of a disease phenotype, and correlating the presence with the base. The TACR1 segment is useful for diagnosing and treating TACR1 ligand mediated diseases, such as asthma. The TACR1 segment is also useful in forensics, paternity testing, correlating polymorphisms with phenotypic traits, and genetic mapping of phenotypic traits. The TACR1 segment is useful in diagnosing and monitoring of diseases such as cancer, inflammation, heart disease, correlating received as cancer, inflammation, heart disease, correction to diseases of central nervous system, and susceptibility to infection to

The invention relates to a method for identifying a reliable diagnostic, prognostic or staging marker for phenotypic conditions characterised by altered DNA methylation. The method involves Obtaining a set of at least two denomic DNA samples, identifying primary differentially methylated CpG dinucleotide sequence positions, selecting a primary differentially methylated CpG dinucleotide sequence position and confirming the class-distinguishable methylation status of the selected sequence position. The method is useful for identifying a reliable diagnostic, prognostic or staging marker for phenotypic conditions characterised by altered DNA methylation e, g cell proliferative disorders, carders, central nervous system disorders, inflammation, disease of the respiratory system, sexual disorders, lesions, inflammation, inflammation, disease, behavioural problems, psychotic disorders, Hosting, discase, cancer, autism, ulcerative colitis or Huntington's disease. The method is also useful for
                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gastrointestinal tract disease, respiratory system disease; inflammation, sexual malfunction, ulcerative colitis; psychotic disorder; hypertension; cardiovascular disorder; immune disorder; Hodgkin's disease; drug abuse; behavioural problem; metabolic disorder; Huntington's disease; dementia; skin disorder; cancer; lesion; autism; therapy; arbitrarily-primed PCR;
